ABSTRACT

Coriander sativum (C. sativum) is one of the most useful essential oil bearing species as well as medicinal plants. Belong to the family umbelliferae /apiaceae. It is highly reputed ayurvedic medicinal plant commonly known as “Dhanya” in India. Plant has played a critical role in maintaining human health. In this phyto-chemical screening secondary metabolites such as cardiac glycosides, terpenoids, steroids, saponin, tannin, flavonoid and alkaloids have screened in chloroform, methanol, and aqueous extract leaf, fruit and stem part of Coriander sativum. In chloroform extract of leaf of Coriander sativum only, terpenoids, and steroids were present. Absence of cardiac glycosidase, saponin, tannin, flavonoid and alkaloid was observed. In methanolic extract of leaf only presents of cardiac glycosidase terpenoids and steroids was observed. Saponin, tannin, flavonoid and alkaloid was absence. In aqueous leaf extract tannin, flavonoid and alkaloid were absent. Rest phytocompound was present. Coriander sativum is a source of valuable bioactive that can used as a medicines in different disorders such as cancer, cardiovascular disease, arthritis, diabetes, gastrointestinal disorders such as anorexia, dyspepsia, diarrhea, pain and vomiting etc.

KEYWORDS: Secondary Metabolites, Bioactive, Phyto-Chemical Screening

Coriander sativum (C. sativum) is one of the most useful essential oil bearing species as well as medicinal plants. Belong to the family umbelliferae /apiaceae. It is highly reputed ayurvedic medicinal plant commonly known as “Dhanya” in India. Plant has played a critical role in maintaining human health. All parts of plant are edible, fresh leaves can be used for garnishing and are common ingredient in many foods like chutneys and salads. Fresh juice of Coriander is extremely advantageous in curing many deficiencies related to vitamins and iron. This plant is used to cure diseases like digestive tract disorders, respiratory tract disorders, urinary tract infection. Its other use in seasoning food preparation. Its seeds leaves are widely used in folk medicine Antifungal antibacterial antioxidant activities are found in C. sativum. It is useful for flavouring agent for food preparation it is also used in food preservation. Prevent food borne disease and food spoilage. The various part of this plant, such as seeds, leaves, flower and fruit possess antioxidant activity, anti-diuretic activity, anti-mutagenic, antimicrobial activity, anthelemintic activity. (Figure 1&2)

Taxonomical/Scientific Classification

Kingdom : plantae
Subkingdom : angiosperm
Division : Eudicot
Class : asterid

Phytochemistry

Seeds: The fruit (seeds and pericarp) are the most widely used component of the coriander plant with the most important constituents being the essential oil and the fatty oil. The fatty oil is around 25% of the seeds while the essential oil content is usually less than 1%. The fatty oil is a light yellow in color and has a characteristic smell. The oil is unique in that it contains high amount of petroselinic acid (C18: 1n-12). High level of total glycolipids (GL) are found in the seeds oil. Major Triacylglycerols (TAG) are tripetroselinin and/or dipetroselinoyloxyglycerol. The main markers of sterols (ST) are stigmasterol, beta-sitosterol, 24-stigmastadienol and camposterol. Total ST estimated to be in the range of 36.93-51.86 mg/g.

Leaves and Stem: The immature green leaves of C. sativum are widely used as fresh herbs, garnishes in chutneys and sauces. Coriander leaves are not as well studied as the fruits. Never the less, the essential oil, flavonoids, phenolic acids and polyphenols are among the other compounds detected in the leaves (Chitravadivu et al., 2009; Chopra et al., 1969; Cowan et al., 1999).

Nutritional Constituent: Coriander consist of water, food energy, proteins, fat, carbohydrates, calcium, phosphorus, sodium, potassium, iron, vitamin A etc.

Chemical Constituents: Coriander consist volatile oil, proteins. Volatile consist of D-lonalool, gerniol, pinene, it is also consist of coriander acetate L-borneol etc.

Toxicology: The consumption of Coriander sativum no toxic effect was seen on human body.

Occurrence: In the word lavel – Coriander sativum is most popular in Malaysia, India, Korea, Thailand, Singapore, were its harvested and cultivated America, Latin, Canada, us etc. In India lavel Maharashtra, Karnataka, Kerala, Tamil nadu, Uttarpradesh, Chhattisgarh, Westbangal, Bihar, Gurjat, Madhyapradesh, Rajistant, Jharkhand, Utrakhand etc.

MATERIALS AND METHODS

Collection of Plant Material

The leaf, stems and fruit of Coriander sativum plant were collected from agricultural field.

Preparation of Plant Extract

The leaf, stem and fruit of Coriander sativum plant were cleaned and dried carefully on room temperature than dried stem, leaf and fruit are grinded and powdered. Than leaf, stem and fruit powder were extracted with methanol, chloroform and distill water for different phytochemical test and identification of different groups.

Phytochemical Screening

The commonly known phytochemicals from Coriander sativum are cardiac glycosides, terpenoids, steroids, saponin, tamin, flavonoids and alkaloids.

Test for Cardiac Glycosides

0.5 ml of each extract was treated with 0.2 ml glacial acetic acid then 1 drop of 3.5% ferric chloride
(FeCl₃) was added to the solution. This was layered with 1 ml of concentrated H₂SO₄. A reddish brown ring was occurred at the interface indicates the presence of cardiac glycosides.

**Test for Teroenoids**

0.5 ml of plant extract was added to the test tube then 2ml of chloroform was mixed to the solution. 3 ml of concentrated H₂SO₄ was added carefully from the wall of the test tube, to form a lower layer. Occurrence of reddish-brown color at the interface indicated the presence of terpenoids.

**Test for Steroid**

0.5ml of extract was dissolved in 3ml of chloroform. The solution was filtered, 2ml of concentrated H₂SO₄ was added to the filtrate to form a lower layer. A reddish-brown color ring at the interface was indicated the presence of steroid.

**Test for Saponin**

0.5ml of extract was taken in the test tube, and then 5ml of D/W was added to it. The solution was vigorously shaken and stable persistent froth was observed for the presence of saponin.

**Test for Tannin**

0.5ml of extract and 5ml of d/w was taken in test tube then it was boiled then filtered. Few drops of concentrated H₂SO₄ and 1% FeCl₃ were added to the filtrate. Deep green, brownish green or blue black coloration was indicated the presence of tannin.

**Test for Flavonoid**

0.5ml of extract and 5ml D/W was added to test tube then it was filtered. 5ml of diluted ammonia solution was added to the filtrate then concentrated H₂SO₄ was added. A yellow coloration indicated the presence of flavonoid. The yellow color disappeared on standing.

**Test for Alkaloid**

0.5 ml dried extract was taken and 3ml of methanol was added to it. Then 300µl of acetic acid (10% of methanol) was added to the solution ammonium hydroxide was added drop wise. Appearance of precipitate indicated the presence of alkaloid.

Phytochemical Screening of Stem Extract of Coriander sativum

Figure 6: Leaf extract in chloroform
RESULTS AND DISCUSSION

In this phytochemical screening secondary metabolites such as cardiac glycosides, terpenoids, steroids, saponin, tannin, flavonoid and alkaloids have screened in chloroform, methanol, and aqueous extract leaf, fruit and stem part of Coriander sativum.

In chloroform extract of leaf of Coriander sativum only, terpenoids, and steroids were present. Absence of cardiac glycosidase, saponin, tannin, flavonoid and alkaloid was observed. In methanolic extract of leaf only presents of cardiac glycosidase terpenoids and steroids was observed. Saponin, tannin, flavonoid and alkaloid was absence. In aqueous leaf extract tannin, flavonoid and alkaloid were absent. Rest phytocompound was present (Savithramma et al., 2014).

In chloroform extract of stem of Coriander cardiac glycosides, terpenoids and steroids were present. In methanolic stem extract phyto-compounds such as cardiac glycosides, terpenoids, and steroids, presence were observed. Both chloroform and methanolic extract
of stem saponin, tannin, flavonoid, alkaloid was not found. In aqueous extract of stem absence of tannin, saponin and alkaloids was observed, rest phyto-compound were present.

In chloroform extract of fruit of Coriander phyto-compounds such as cardiac glycosides, terpenoids and steroids were found. In methanolic fruit extract absence of flavonoid and alkaloids were observed, rest phyto-compounds were present. In aqueous extract of fruit absence of saponin, tannin and alkaloid was observed. Rest phyto-compound such as cardiac glycosidase, terpenoids, steroids, and flavonoids were present.

Ashok Kumar et al., 2010 had worked on phytochemical screening of Coriander sativum linn. They had prepared methanolic extract of fruit and performed phytochemical screening by qualitative and thin layer chromatography technique and they had reported presence of linalool, linanyl acetate, cymene, triterpene in fruit part of Coriander sativum. Beegum et al, 2014. had done qualitative analysis for the presence of several antioxidant compounds. They used the seed extract of Coriander sativum and reported the presence of principle components responsible for high anti-oxidant activity of Coriander sativum such as ascorbate, riboflavin, tocopherol, polyphenols, gallic acid, caffeic acid, ellagic acid, quercetin, kaempferol. All the results show in table 1, 2, & 3 and figure 3 to 11.
